

We offer IT solutions to meet the business needs of our clients.

So, we don't have a standard day at my company. Everything is base on what we have in hand. Mostly consulting and project base.

Sometimes, I can find myself ;

On Linux:

- Writing bash shell script to automate tasks
- Doing an inventory of a server that need to be decommissioned.
- Troubleshooting a server that is down or slow
- Building Load balancer using the haproxy software
- Secure the linux: We use the CIS benchmark
- configure the dns on a server

On DevOps:

- Building a full CI/CD pipeline
- Setting up infrastructure as a code
- Resolving git conflit
- Doing a quick integration in jenkins
- Writing roles in Ansible that a client needs to run
- With clients who need to build their application: I have to figure out how they want to deploy the application

On Cloud:

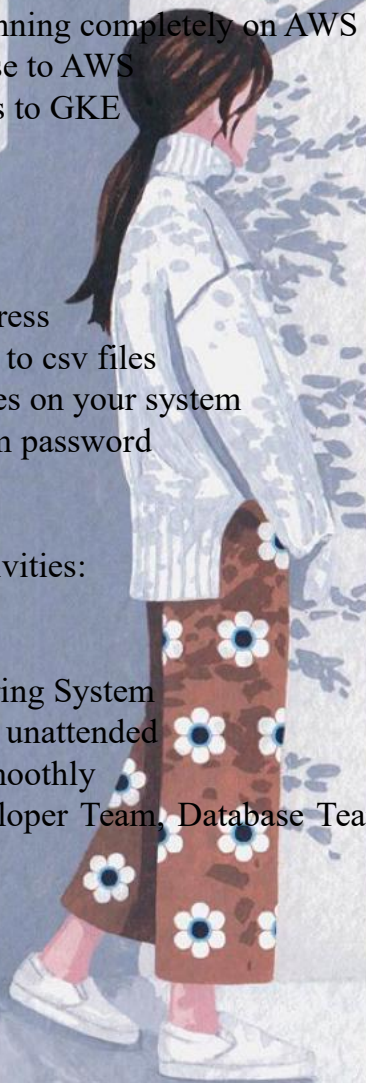

- Building of 3 tier application running completely on AWS
- Migrating application on-premise to AWS
- Deploy application from Jenkins to GKE
- Loading files in BigQuery

On Scripting Language:

- Bash shell script to setup wordpress
- Python script to convert txt files to csv files
- Python script to find specific files on your system
- Python script to generate random password

However, Below is my regular daily activities:

- \*\* Checking Email/ JIRA Tickets
- \*\* Checking Notifications from monitoring System
- \*\* Ensuring that there is no critical alert unattended
- \*\* Making sure that the pipeline runs smoothly
- \*\* Interaction with other teams ( Developer Team, Database Team, Network Team, Production Team)

- \*\* Automation for repetitive tasks
- \*\* Dealing with Legacy stuff
- \*\* Creating jenkins jobs for deployment
- \*\* Deploying code on Dev & Prod Servers
- \*\* Removing bottleneck
- \*\* Documentation
